Dear Hiring Committee,

I saw the job post on **Medpace's careers website** and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer, Medical Imaging** at **Medpace**. With hands on experience applying deep learning to automated analysis of visual data and building software through a full, testing-driven development lifecycle, I am excited about the opportunity to contribute to **Medpace** and support the imaging services team's work quantifying CT and MRI data for clinical research.

Here are reasons that make me a great fit for the role:

- **Deep learning applied to visual/video quantification:** As a Graduate Researcher, I designed a two-stage deep learning pipeline that analyzes and quantifies visual content from screen recordings for automated Android bug reproduction, evaluating against a published vision-language baseline (GPT-4o + GroundingDINO + CLIP) across 53 runs on 20+ apps and demonstrating a 25.7x latency reduction while preserving accuracy.

- **Unit testing and software validation:** At Siemens Industry Software, I served as Quality Coach and SonarQube Specialist, increasing automated unit-test coverage from 35% to 78% by enforcing coding standards and quality gates, and built a Go + Terratest framework that caught 95% of misconfigurations before production, giving me direct experience writing and reviewing test scripts as part of a validation process.

- **Regulated software development lifecycle:** My work migrating and upgrading Teamcenter X, a regulated industry PLM platform, across 40+ production environments required following defined SDLC processes, structured design reviews, and rollback-tested deployment frameworks (Ansible Blue-Green), reducing upgrade downtime by 50% without compromising process discipline.

- **Programming languages and cloud systems:** I have hands on experience with Python, C#, JavaScript, TypeScript, and SQL, along with AWS and Azure cloud systems, Git-based code management, and machine learning frameworks including PyTorch, TensorFlow, and Keras, which I used to build and evaluate an LSTM classifier on 400K+ news headlines.

- **Communication and end-user support:** I mentored 5 software engineers through structured onboarding and technical documentation at Siemens, and built a self-service developer platform adopted by 15 engineers, reflecting the communication and end-user support skills this role requires.

I am available for full-time work after December 2026. As a Master's student at the University of Cincinnati and someone who values professionalism and growth, I am enthusiastic about contributing to Medpace's mission of accelerating safe and effective medical therapeutics through imaging science.

Please find my CV attached below. I look forward to hearing from you. I would be excited to help build tools that bring quantitative rigor to medical imaging in service of clinical research.
Regards,
