Dear Hiring Committee,

I saw the job post on the Mastercard careers website and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer II** at **Mastercard**. With hands on experience building secure production systems, CI/CD pipelines, and distributed deployment platforms, I am excited about the opportunity to contribute to **Mastercard** and support the **Payment Enablement** team's mission of delivering secure, accessible, and reliable switching services.

Here are reasons that make me a great fit for the role:

- **Software design and secure, scalable development:** At Siemens Industry Software, I automated Teamcenter X infrastructure workflows with Python and Boto3, replacing legacy scripts and cutting deployment time by 40 percent across AWS environments, while managing HashiCorp Vault secrets and IAM access policies to strengthen security posture across production and non production environments.

- **Code quality, security scanning, and testing:** As Quality Coach and SonarQube Specialist for the Agile Release Train, I raised automated code coverage from 35 percent to 78 percent by enforcing coding standards and CI/CD quality gates, giving me direct experience with code quality and security scanning tools similar to Sonar and Checkmarx that this role requires.

- **CI/CD pipelines and release automation:** I designed and maintained GitOps based CI/CD pipelines with GitLab CI/CD and ArgoCD, migrating 40 or more production environments to Kubernetes with Helm, and built an Ansible based Blue Green deployment framework with automated rollback that reduced production upgrade downtime by 50 percent.

- **Troubleshooting distributed, mission critical systems:** I executed 44 production environment upgrades in four months, diagnosing and resolving live infrastructure issues across Linux, EC2, databases, and distributed Teamcenter X services without service interruption, building strong operability and root cause analysis skills for high availability systems.

- **Collaboration and knowledge sharing:** I mentored 5 software engineers through structured onboarding and code review, and in my current graduate research I designed a two stage LLM pipeline for Android bug reproduction that achieved a 25.7x latency reduction over a published baseline, reflecting my ability to estimate, design, and deliver technical work independently and as part of a team.

I am available for full time work after my graduation in December 2026. As a Master's student at the University of Cincinnati and someone who values professionalism and growth, I am enthusiastic about contributing to **Mastercard** and helping build secure, reliable payment enablement systems.

Please find my CV attached below. I look forward to hearing from you. I would be excited to help strengthen the security and reliability of the payment switching services that power transactions worldwide.
Regards,
