Dear Hiring Committee,

I saw the job post on **OneTrust's careers website** and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer** at **OneTrust**. With hands on experience operating production cloud infrastructure, building observability and CI/CD automation, and applying LLMs to reliability workflows, I am excited about the opportunity to contribute to **OneTrust** and support the R&D team building a highly available, performant application platform.

Here are reasons that make me a great fit for the role:

- **Application observability and reliability automation:** At Siemens Industry Software, I diagnosed live infrastructure issues across Linux, EC2, and databases using CloudWatch metrics and Datadog log correlation during 44 production environment upgrades in 4 months, and designed an Ansible based Blue-Green deployment framework that reduced production upgrade downtime by 50%, direct experience eliminating toil and improving reliability at the service level.

- **Cloud infrastructure and CI/CD, infrastructure as code:** I migrated 40+ production environments to Kubernetes using ArgoCD, Helm, and GitLab CI/CD, and automated provisioning with Terraform and Ansible, reducing deployment time by 40%, hands on experience with the exact CI/CD and infrastructure as code stack (Terraform, Helm, GitLab) this role requires.

- **AI assisted reliability workflows:** My current graduate research builds a memory-augmented LLM pipeline in Python using Google Gemini 2.5 Pro and Vertex AI, achieving a 25.7x latency reduction over a published GPT-4o baseline while preserving task accuracy, and I designed an evidence-grounded RAG pipeline with citation-backed answers to reduce hallucination in a healthcare application, experience directly applicable to building AI assisted incident response and log summarization tools.

- **Python and Java automation, cross-team collaboration:** I have hands on experience with Java, Python, and Bash for operational automation, and as Quality Coach and SonarQube Specialist at Siemens, I increased automated code coverage from 35% to 78% while mentoring 5 engineers, skills aligned with your emphasis on scripting for incident response and partnering across Engineering, Operations, and Product teams.

I am available to work with you after my graduation in December 2026. As a Master's student at the University of Cincinnati and someone who values reliable, well instrumented systems, I am enthusiastic about contributing to OneTrust's mission of enabling responsible innovation through trusted data and AI.

Please find my CV attached below. I look forward to hearing from you. I would be excited to help build the observability and AI assisted reliability tooling that keeps OneTrust's platform trusted at scale.
Regards,
