Dear Hiring Committee,

I saw the job post on **Nimble Robotics' careers page** and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Robotics Software Engineer, Nimble Brain** at **Nimble Robotics**. With hands on experience building production infrastructure, device-automation pipelines, and real-time control loops, I am excited about the opportunity to contribute to **Nimble** and help build the software foundation for your autonomous supply chain robots.

Here are reasons that make me a great fit for the role:

- **Real-time control, sensing, and high-reliability task execution:** As a Graduate Researcher at the University of Cincinnati, I built a device-automation harness (ADB, uiautomator2) with stall detection and closed-loop decision execution for Android task reproduction, integrating live sensor and screen-state feedback into a real-time control loop across 20+ apps.

- **Tools for data processing, validation, and debugging:** I designed a two-stage memory-augmented LLM pipeline decoupling scene understanding from device automation, and built a config-driven experimental harness with versioned run-artifact schemas, achieving a 25.7x latency reduction over the published ViBR baseline while preserving task-completion fidelity.

- **Integrating frontier AI into production systems, safely and predictably:** My research work directly integrates Gemini 2.5 Pro into closed-loop device automation, and my PolicyPilot project architected an evidence-grounded RAG pipeline over Gemini forcing citation-backed answers to eliminate hallucination in high-stakes decisions, an approach to safe AI integration I would bring to robot behaviors at Nimble.

- **High-reliability, production-grade software at scale:** At Siemens Industry Software, I executed 44 production environment upgrades in 4 months, diagnosing live infrastructure issues across Linux, EC2, databases, and services, and designed an Ansible-based Blue-Green deployment framework that reduced production upgrade downtime by 50% while enabling reliable rollback.

- **Testing, documentation, and cross-functional collaboration:** As Quality Coach and SonarQube Specialist for the Agile Release Train, I increased automated code coverage from 35% to 78% by enforcing coding standards and CI/CD quality gates, and mentored 5 software engineers through structured onboarding.

I am available for full-time work after my graduation in December 2026. As a Master's student at the University of Cincinnati and someone who values professionalism and growth, I am enthusiastic about contributing to Nimble's mission of building the autonomous supply chain and helping bring generalist robot autonomy to real production warehouses.

Please find my CV attached below. I look forward to hearing from you. I would be excited to help build the software that powers Nimble's next generation of autonomous robots.

Regards,
