Dear Hiring Committee,

I saw the job post on the Sola careers page and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer, Backend** at **Sola**. With production experience building distributed cloud infrastructure and AI orchestration pipelines, I am excited about the opportunity to contribute to **Sola** and help build reliable, deterministic execution on top of non-deterministic AI models.

Here are reasons that make me a great fit for the role:

- **Owning systems that automate work at scale:** At Siemens Industry Software, I automated Teamcenter X infrastructure workflows with Python (Boto3), cutting deployment time by 40% across AWS environments, and executed 44 production environment upgrades in 4 months while diagnosing live issues across Linux, EC2, and databases.

- **Building reliable, distributed backend systems:** I migrated 40+ production environments to Kubernetes using ArgoCD, Helm, and GitLab CI/CD, and designed an Ansible based Blue Green deployment framework that reduced upgrade downtime by 50% with automated rollback within 15 minutes, the kind of reliability and observability discipline durable workflow execution needs.

- **Bringing AI systems into production:** My graduate research builds a two-stage memory-augmented LLM pipeline for Android automation, using Gemini and Vertex AI to condition closed-loop device execution on structured memory instead of raw per-step inference, achieving a 25.7x latency improvement over a published baseline while preserving task fidelity. This is direct hands-on experience designing adaptive execution logic on top of AI models.

- **Full-stack ownership across the backend:** I am proficient in Python and TypeScript, and have built REST APIs, MCP tool-calling servers, and database backed services end to end. In PolicyPilot, I designed a 17-tool MCP server with schema validation at every boundary so external AI agents could safely drive multi-step workflows, closely mirroring the workflow-builder backend problem Sola is solving.

- **Drawn to early-stage, high-ownership environments:** I built and shipped a self-service developer platform at Siemens end to end, from CLI to dashboard, adopted by 15 engineers, and enjoy the ambiguity of building systems from the ground up rather than maintaining existing ones. A small, in-person team shipping fast on a hard technical problem is exactly the environment I want to be in.

I am available to work with you after my graduation in December 2026, and am glad to relocate to New York City. As a Master's student at the University of Cincinnati and someone who enjoys building reliable systems on top of AI, I am enthusiastic about contributing to Sola's orchestration platform and helping scale it to millions of executions per month.

Please find my CV attached below. I look forward to hearing from you. Sola's mission of making agentic automation reliable enough for Fortune 100 workflows is exactly the kind of hard, high-impact problem I want to help solve.

Regards,
