Dear Hiring Committee,

I saw the job post on the **LearnLux** careers page and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Senior Back End Engineer, Data and Cloud** at **LearnLux**. With hands on experience building backend automation, SQL based data pipelines, and cloud infrastructure for production SaaS systems, I am excited about the opportunity to contribute to LearnLux and support your mission of building scalable, reliable financial wellbeing tools for enterprise clients.

Here are reasons that make me a great fit for the role:

- **Hands on experience with data systems, pipelines, and warehouses:** I built an end to end ML data pipeline forecasting NYC taxi demand across 263 zones, ingesting a 2.3M row dataset through a Spark based bronze/silver/gold data warehouse and serving predictions through a FastAPI backend backed by PostgreSQL, cutting prediction error by 43% over baseline.

- **Backend engineering ownership of scalable production SaaS systems:** At Siemens Industry Software, I automated Teamcenter X infrastructure workflows with Python and Boto3, cutting deployment time by 40%, and executed 44 production environment upgrades in four months while diagnosing live issues across Linux, EC2, databases, and services.

- **Distributed systems and cloud infrastructure experience:** I migrated 40+ production environments from process based deployments to Kubernetes using ArgoCD, Helm, GitLab CI/CD, and HashiCorp Vault, and designed an Ansible based Blue-Green deployment framework that reduced production upgrade downtime by 50% while enabling reliable rollback.

- **Infrastructure as code and automation:** As a Software Developer Intern, I automated AWS resource provisioning with Terraform, reducing deployment time by 30%, and built a Go and Terratest validation framework that caught 95% of misconfigurations before they reached production.

- **AI driven tooling to improve engineering productivity:** My current graduate research applies a memory augmented LLM pipeline to Android bug reproduction, achieving a 25.7x latency reduction over a published baseline, reflecting my comfort using agentic and AI assisted approaches to accelerate real engineering work.

I am available to work with you after my graduation in December 2026. As a Master's student at the University of Cincinnati and someone who values ownership, clear communication, and building reliable systems in fast moving environments, I am enthusiastic about contributing to LearnLux's engineering team and helping scale the platform that powers financial wellbeing for so many employees.

Please find my CV attached below. I look forward to hearing from you. I would be excited to help build the backend systems behind a mission that gives people real confidence about their financial future.
Regards,
