Dear Hiring Committee,

I saw the job post on Plaid's careers page and thought I'd be a good fit for it. I am a Master's student at the University of Cincinnati seeking a Software Engineer, Backend role at Plaid, and a new graduate with over two years of production software engineering experience. Plaid's mission of building secure financial infrastructure lines up with the backend systems I have built and operated.

Here are reasons that make me a great fit for the role:

1. Building and maintaining scalable, reliable backend systems: At Siemens, I migrated over 40 production environments to Kubernetes using ArgoCD, Helm, and GitLab CI/CD, and executed 44 production upgrades in four months while diagnosing live infrastructure issues without service interruptions.

2. Shipping and maintaining APIs: In my PolicyPilot project, I built a full-stack application with an Express REST API and a 17-tool backend server, using Zod schema validation at every data boundary to eliminate a class of runtime type-mismatch bugs.

3. Testing, debugging, and monitoring in production: I served as Quality Coach and SonarQube Specialist at Siemens, increasing automated test coverage from 35 percent to 78 percent, and designed a Blue-Green deployment framework that cut upgrade downtime by 50 percent with reliable rollback.

4. Collaboration and ownership: My Siemens experience built production ownership, calm debugging habits, and documentation-first communication through executing upgrades and mentoring five junior engineers.

I am available to work with you after my graduation in December 2026. As a Master's student at the University of Cincinnati and someone who values professionalism, growth, and reliable engineering practices, I am enthusiastic about contributing to Plaid in this role.

Please find my CV attached below. I look forward to hearing from you.
