Dear Hiring Committee,

I saw the job post on **the D-Wave careers website** and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer I** at **D-Wave Quantum Inc.** I have hands on experience building backend services, platform infrastructure, and internal tools, and I am excited about contributing to the Systems Software Engineering team and the software that connects gate-model quantum processors with the applications used to operate them.

Here are reasons that make me a great fit for the role:

- **Collaborating across disciplines to turn requirements into solutions:** At Siemens Industry Software, I worked with software engineers, SREs, and QA across an Agile Release Train to gather requirements and ship infrastructure automation, and I mentored 5 engineers through structured onboarding. In my earlier internship I partnered with a government department to build and deploy a full-stack React and MySQL workflow app that improved operational efficiency by 40%.

- **Designing, developing, testing, and maintaining software and tools:** I automated Teamcenter X infrastructure workflows in Python (Boto3), replacing legacy Ruby scripts and cutting deployment time by 40% across AWS, and built a self-service developer platform (dashboard plus CLI/YAML automation) adopted by 15 engineers that cut environment lifecycle time by up to 90%.

- **Writing clean, documented, well-tested code with peer review:** As Quality Coach and SonarQube Specialist, I raised automated code coverage from 35% to 78% by enforcing coding standards and CI/CD quality gates. On PolicyPilot I added Zod schema validation at every data boundary with Vitest unit and integration tests, and I use Python, Go, and Java with Git across all of my work.

- **Troubleshooting, debugging, and optimizing performance:** I executed 44 production environment upgrades in 4 months, diagnosing live issues across Linux, EC2, and databases using CloudWatch and Datadog. In my graduate research I redesigned an LLM pipeline for Android bug reproduction and achieved a 25.7x latency reduction (39.4s versus 1012.1s per run) over the ViBR baseline.

- **Contributing across the full software lifecycle including deployment and operational support:** I built GitOps CI/CD pipelines with GitLab CI/CD and ArgoCD and an Ansible Blue-Green deployment framework that reduced upgrade downtime by 50% with 15-minute rollback, and I migrated 40+ production environments to Kubernetes using Helm, Amazon EFS, and HashiCorp Vault.

I am available for full-time work after December 2026, aligned with my graduation date. As a Master's student at the University of Cincinnati and someone who values professionalism and growth, I am enthusiastic about contributing to **D-Wave Quantum Inc.** and the quantum processor execution stack.

Please find my CV attached below. I look forward to hearing from you. Helping build reliable software at the intersection of engineering and quantum computing hardware is exactly the kind of challenge I want to grow into.

Regards,
