Dear Hiring Committee,

I saw the job post on the **Cox Automotive careers website** and thought I'd be a good fit for it.

I am a Master's student in Computer Science at the University of Cincinnati, graduating December 2026, looking for a role as a **Software Engineer II** at **Cox Automotive**. With production experience building backend services, designing and versioning REST APIs, modernizing legacy systems, and operating containerized workloads in AWS, I am excited to contribute to **Cox Automotive** and the platforms behind brands like Autotrader, Kelley Blue Book, and Manheim.

Here are reasons that make me a great fit for the role:

- **Designing, building, and maintaining production software in a modern object-oriented language:** At Siemens Industry Software, I designed and maintained production backend automation for Teamcenter X in Python with object-oriented service modules and REST API integrations, replacing legacy Ruby scripts and cutting deployment time by 40% across AWS environments.

- **Microservices, service boundaries, and distributed failure modes:** I migrated 40+ production environments from process based deployments to containerized Kubernetes microservices using ArgoCD, Helm, and GitLab CI/CD, and modeled provisioning state in DynamoDB and relational stores with indexed lookups that supported idempotent retries and reliable partial failure recovery.

- **REST API design, relational databases, and managed schema migrations:** On PolicyPilot I built a full stack TypeScript app with an Express REST API exposing 17 versioned tool APIs, each guarded by schema validation at every data boundary. On NYC Mobility Forecasting I built a FastAPI service over PostgreSQL with a Redis cache, applying schema design, indexing, and query tuning.

- **Automated testing through CI/CD, static analysis, and production observability:** As Quality Coach and SonarQube Specialist for the Agile Release Train, I raised automated test coverage from 35% to 78% by enforcing CI/CD quality gates, and I executed 44 production upgrades in 4 months, triaging live incidents with CloudWatch metrics, tracing, and Datadog log correlation.

- **Senior ownership and raising engineering standards:** I designed an Ansible based Blue-Green deployment framework with automated rollback that cut production upgrade downtime by 50%, and mentored 5 engineers through structured onboarding.

I am available for full time work after December 2026. As a Master's student at the University of Cincinnati and someone who values professionalism and growth, I am enthusiastic about contributing to **Cox Automotive** and building the secure, resilient software that powers how the world buys, owns, and sells cars.

Please find my CV attached below. I look forward to hearing from you. I would be glad to help the teams behind Autotrader, Kelley Blue Book, and Manheim deliver reliable software that dealers and drivers depend on every day.

Regards,
